

How a heterotroph rescues Prochlorococcus from nitrogen starvation

MED4 dies axenically under N-starvation but survives 90+ days with Alteromonas — KG re-analysis of Weissberg et al. 2025 shows why

Coculture erases the transcriptional N-stress signature (A), yet a protein-level signature persists (A, B) — a genuine RNA/protein discordance. The signature is specific (C) and dominated by stress, translation & photosynthesis genes (D).
